

Python For Data Science Cheat Sheet

NumPy Basics

Learn Python for Data Science Interactively

NumPy

The NumPy library is the core library for scientific computing in Python. It provides a high-performance multidimensional array object, and tools for working with these arrays.

Use the following import convention:

```
>>> import numpy as np
```

NumPy Arrays

Creating Arrays

```
>>> a = np.array([1,2,3])
>>> b = np.array([(1.5,2,3), (4,5,6)], dtype = float)
>>> c = np.array([(1.5,2,3), (4,5,6)], [(3,2,1), (4,5,6)]],
                dtype = float)
```

Initial Placeholders

<pre>>>> np.zeros((3,4)) >>> np.ones((2,3,4),dtype=np.int16) >>> d = np.arange(10,25,5) >>> np.linspace(0,2,9) >>> e = np.full((2,2),7) >>> f = np.eye(2) >>> np.random.random((2,2)) >>> np.empty((3,2))</pre>	<p>Create an array of zeros</p> <p>Create an array of ones</p> <p>Create an array of evenly spaced values (step value)</p> <p>Create an array of evenly spaced values (number of samples)</p> <p>Create a constant array</p> <p>Create a 2X2 identity matrix</p> <p>Create an array with random values</p> <p>Create an empty array</p>
--	---

I/O

Saving & Loading On Disk

```
>>> np.save('my_array', a)
>>> np savez('array.npz', a, b)
>>> np.load('my_array.npy')
```

Saving & Loading Text Files

```
>>> np.loadtxt("myfile.txt")
>>> np.genfromtxt("my_file.csv", delimiter=',')
>>> np.savetxt("myarray.txt", a, delimiter=" ")
```

Data Types

<pre>>>> np.int64 >>> np.float32 >>> np.complex >>> np.bool >>> np.object >>> np.string_ >>> np.unicode_</pre>	<p>Signed 64-bit integer types</p> <p>Standard double-precision floating point</p> <p>Complex numbers represented by 128 floats</p> <p>Boolean type storing TRUE and FALSE values</p> <p>Python object type</p> <p>Fixed-length string type</p> <p>Fixed-length unicode type</p>
---	--

Inspecting Your Array

<pre>>>> a.shape >>> len(a) >>> b.ndim >>> e.size >>> b.dtype >>> b.dtype.name >>> b.astype(int)</pre>	<p>Array dimensions</p> <p>Length of array</p> <p>Number of array dimensions</p> <p>Number of array elements</p> <p>Data type of array elements</p> <p>Name of data type</p> <p>Convert an array to a different type</p>
---	--

Asking For Help

```
>>> np.info(np.ndarray.dtype)
```

Array Mathematics

Arithmetic Operations

<pre>>>> g = a - b array([[-0.5, 0. , 0.], [-3. , -3. , -3.]]) >>> np.subtract(a,b) >>> b + a array([[2.5, 4. , 6.], [5. , 7. , 9.]]) >>> np.add(b,a) >>> a / b array([[0.66666667, 1. , 1.], [0.25 , 0.4 , 0.5]]) >>> np.divide(a,b) >>> a * b array([[1.5, 4. , 9.], [4. , 10. , 18.]]) >>> np.multiply(a,b) >>> np.exp(b) >>> np.sqrt(b) >>> np.sin(a) >>> np.cos(b) >>> np.log(a) >>> e.dot(f) array([[7. , 7.]])</pre>	<p>Subtraction</p> <p>Subtraction</p> <p>Addition</p> <p>Addition</p> <p>Division</p> <p>Division</p> <p>Multiplication</p> <p>Multiplication</p> <p>Exponentiation</p> <p>Square root</p> <p>Print sines of an array</p> <p>Element-wise cosine</p> <p>Element-wise natural logarithm</p> <p>Dot product</p>
---	---

Comparison

<pre>>>> a == b array([[False, True, True], [False, False, False]], dtype=bool) >>> a < 2 array([True, False, False], dtype=bool) >>> np.array_equal(a, b)</pre>	<p>Element-wise comparison</p> <p>Element-wise comparison</p> <p>Array-wise comparison</p>
--	--

Aggregate Functions

<pre>>>> a.sum() >>> a.min() >>> b.max(axis=0) >>> b.cumsum(axis=1) >>> a.mean() >>> b.median() >>> a.corrcoef() >>> np.std(b)</pre>	<p>Array-wise sum</p> <p>Array-wise minimum value</p> <p>Maximum value of an array row</p> <p>Cumulative sum of the elements</p> <p>Mean</p> <p>Median</p> <p>Correlation coefficient</p> <p>Standard deviation</p>
--	---

Copying Arrays

<pre>>>> h = a.view() >>> np.copy(a) >>> h = a.copy()</pre>	<p>Create a view of the array with the same data</p> <p>Create a copy of the array</p> <p>Create a deep copy of the array</p>
--	---

Sorting Arrays

<pre>>>> a.sort() >>> c.sort(axis=0)</pre>	<p>Sort an array</p> <p>Sort the elements of an array's axis</p>
--	--

Subsetting, Slicing, Indexing

Also see Lists

<p>Subsetting</p> <pre>>>> a[2] 3 >>> b[1,2] 6.0</pre> <p>Slicing</p> <pre>>>> a[0:2] array([1, 2]) >>> b[0:2,1] array([2., 5.]) >>> b[:1] array([[1.5, 2., 3.]]) >>> c[1,...] array([[3., 2., 1.], [4., 5., 6.]]) >>> a[: :-1] array([3, 2, 1])</pre> <p>Boolean Indexing</p> <pre>>>> a[a<2] array([1])</pre> <p>Fancy Indexing</p> <pre>>>> b[[1, 0, 1, 0],[0, 1, 2, 0]] array([4. , 2. , 6. , 1.5]) >>> b[[1, 0, 1, 0]][:,[0,1,2,0]] array([[4., 5., 6., 4.], [1.5, 2., 3., 1.5], [4., 5., 6., 4.], [1.5, 2., 3., 1.5]])</pre>	<table border="1"><tr><td>1</td><td>2</td><td>3</td></tr><tr><td>1.5</td><td>2</td><td>3</td></tr><tr><td>4</td><td>5</td><td>6</td></tr></table> <p>Select the element at the 2nd index</p> <table border="1"><tr><td>1</td><td>2</td><td>3</td></tr><tr><td>1.5</td><td>2</td><td>3</td></tr><tr><td>4</td><td>5</td><td>6</td></tr></table> <p>Select the element at row 1 column 2 (equivalent to b[1][2])</p> <table border="1"><tr><td>1</td><td>2</td><td>3</td></tr><tr><td>1.5</td><td>2</td><td>3</td></tr><tr><td>4</td><td>5</td><td>6</td></tr></table> <p>Select items at index 0 and 1</p> <table border="1"><tr><td>1</td><td>2</td><td>3</td></tr><tr><td>1.5</td><td>2</td><td>3</td></tr><tr><td>4</td><td>5</td><td>6</td></tr></table> <p>Select items at rows 0 and 1 in column 1</p> <table border="1"><tr><td>1</td><td>2</td><td>3</td></tr><tr><td>1.5</td><td>2</td><td>3</td></tr><tr><td>4</td><td>5</td><td>6</td></tr></table> <p>Select all items at row 0 (equivalent to b[0:1, :]) Same as [1,:,:]</p> <p>Reversed array a</p> <table border="1"><tr><td>1</td><td>2</td><td>3</td></tr></table> <p>Select elements from a less than 2</p> <p>Select elements (1,0),(0,1),(1,2) and (0,0)</p> <p>Select a subset of the matrix's rows and columns</p>	1	2	3	1.5	2	3	4	5	6	1	2	3	1.5	2	3	4	5	6	1	2	3	1.5	2	3	4	5	6	1	2	3	1.5	2	3	4	5	6	1	2	3	1.5	2	3	4	5	6	1	2	3
